Candidate's Examination Number

THE UNITED REPUBLIC OF TANZANIA NATIONAL EXAMINATIONS COUNCIL FORM TWO SECONDARY EDUCATION EXAMINATION

0031

PHYSICS

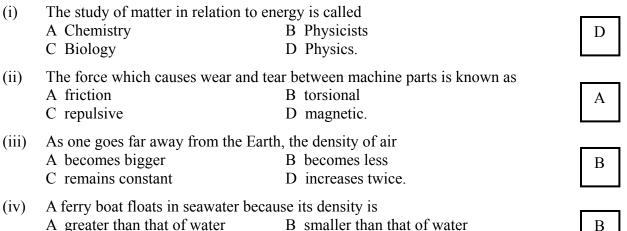

Time: 2:30 Hours

Friday, 28th November 2014 a.m.

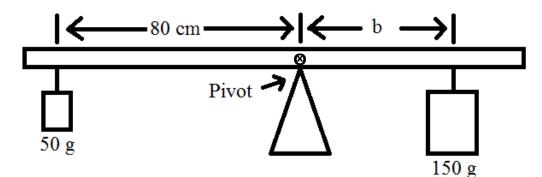

Instructions

- 1. This paper consists of sections A, B, and C.
- 2. Answer all questions in the spaces provided.
- 3. All writing must be in blue or black ink except drawings which must be in pencil.
- 4. All communication devices and calculators are not allowed in the examination room.
- 5. Write your **Examination Number** at the top right corner of every page.
- 6. Where necessary the following constants may be used:
 - (i) Acceleration due to gravity, $g = 10 \text{ m/s}^2$
 - (ii) Density of water = 1 g/cm^3 or $1,000 \text{ kg/m}^3$

1. For each of the items (i) - (xx), choose the correct answer among the given alternatives and write the letter in the box provided.

- C the same as its weight
- B smaller than that of water D greater than its weight.
- (v) Study Figure 1 below.

How far from the pivot must the 150 g mass be placed for the system to be in equilibrium?

Sum of anticlockwise moments Sum of clockwise moments = Left Force \times Left Distance Right Force × Right Distance = Left Mass \times g \times Left Distance = Right Mass \times g \times Right distance Right Mass × Right distance Left Mass \times Left Distance = $50 g \times 80 cm$ $150 q \times b$ = $50 g \times 80 cm$ = b 150 g $5\theta g \times 80 cm$ = b 150 a

D

Candidate's Examination Number

	$\frac{80 \ cm}{3}$	= b	
	26.7 cm	= b	
	A 16.7 cm C 36.6 cm	B 17.6 cm D 26.7 cm.	
(vi)	A patient who is to get an injection y feels much pain on his skin due to A very high pressure C blunt of the needle tip	when a nurse applied a small force to push a ne B very low pressure D small applied force.	edle A
(vii)	The suspended magnetic needle alw called A geographic meridian C geographic declination	ays comes to rest with its axis in a vertical plan B magnetic meridian D magnetic declination.	B
(viii)	As the angle between two plane mir A decreases C remains constant	rors increases, the number of images formed B increases D goes to infinite.	A
(ix)	Which of the following materials do A glass C clear plastics	bes not allow light to pass through B tinted glass D human bodies	D
(x)	To view objects that are out of direc A telescope C periscope	t vision we can use a B microscope D slide projector.	С
(xi)	The process by which water soaks the A capillarity C diffusion	hrough the cells of rice and beans is called: B cohesion D osmosis.	D
(xii)	Which of the following is a property A Boils at 78°C C Wets glass	of mercury as a thermometric liquid? B Boils at 360°C D Expands rapidly	В
(xiii)	The area under a velocity-time grap A distance C acceleration	h represents B speed D deceleration	A
(xiv)	If the pitch of a micrometer screw g A 10 equal divisions C 50 equal divisions	auge is 0.5 mm, then its thimble has B 100 equal divisions D 500 equal divisions	С
(xv)	Which of the following is a magnetic A Copper C Zinc	c material? B Cobalt D Brass.	В

Page 3 of 13 Find this and other free resources at http://maktaba.tetea.org

- (xvi) An electrostatic machine which produces an unlimited supply of sparks by induction is called
 - A a gold leaf electroscope C a generator
- B an electrophorus D a speedometer.
- (xvii) The quantity of electric current caused by excess electrons is called
 - A coulomb B electric charge C electric current D electrification.

This question isn't very clear, but it asks for a quantity. There are two quantities in the multiple choice options. Electric charge is a derived quantity. Electric charge is a measure of the difference between the number of protons and number of electrons in an object. An object with more protons than electrons will be positively charged while an object with more electrons will be negatively charged. Electric current is one of the fundamental quantities of physics. Electric current is the flow of electric charge. I believe that the answer should be electric charge since the question mentions excess electrons, but I'm not positive.

(xviii) Which of the following is not a sustainable source of energy?

A Sun	B generator
C wind	D sea waves

- (xix) A temperature of 68°C is equivalent to
 - $T_{f} = \frac{9^{\circ}F}{5^{\circ}C}T_{c} + 32^{\circ}C$ $T_{f} = \frac{9^{\circ}F}{5^{\circ}C}68^{\circ}C + 32^{\circ}F$ $T_{f} = \frac{9^{\circ}F}{5^{\circ}C}68^{\circ}C + 32^{\circ}F$ $T_f = 122.4^{\circ}F + 32^{\circ}F$ $T_f = 154.4^{\circ}F$

A 20°F	B 45°F
C 154.4°F	D 90.4°F.

- (xx) "Action and reaction are equal in magnitude but opposite in direction." This statement refers to
 - A the law of inertia
- B Newton's second law of motion
- C the principle of moments
- D Newton's third law of motion.

С

SECTION B (40 Marks)

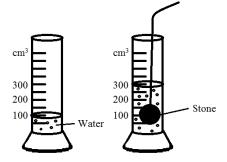

2. Match each item in **List A** with a correct response in **List B** by writing its letter below the number of the corresponding item in the table provided.

	LIST A	LIST B
(i)	Measures how much the position has changed.	A. Gravitational acceleration.
(ii)	Measures the net change in position.	B. Average speed.
(iii)	Rate of change of distance.	C. Acceleration.
(iv)	Rate of change of displacement.	D. Uniform acceleration.
(v)	The constant rate of change of displacement.	E. Free-fall motion.
(vi)	Rate of change of velocity.	F. Distance.
(vii)	Motion under the effects of gravity.	G. Speed.
viii)	Measures the rate at which position changes.	H. Speed in metres.
		I. Velocity.
		J. Uniform velocity.
		K. Displacement.

LIST A	(i)	(ii)	(iii)	(iv)	(v)	(vi)	(vii)	(viii)
LIST B	F	Κ	G	Ι	J	С	Е	Ι

- 3. Complete each of the following statements by writing the correct answer in the space provided.
 - (i) The product of mass and velocity of a body is called <u>linear momentum</u>.
 - (ii) Claw hammers and pairs of scissors are in which class of levers? <u>class 1</u>
 - (iii) Weight has the same SI unit as <u>force</u>.
 - (iv) An instrument used to measure pressure of a gas is known as <u>a barometer</u>.
 - (v) The tendency of a liquid to rise in narrow tubes is called <u>capillary action</u>.
- 4. (a) Define the following terms as applied in measurements and give two examples:
 - (i) Fundamental quantities are independent quantities that describe the physical world which cannot be described as a combination of other base quantities. Two examples of fundamental quantities are mass and time. (Other fundamental quantities are electric current, thermodynamic temperature, amount of matter, luminosity, and distance.)
 - (ii) Derived quantities <u>are quantities that can be made from a combination of the</u> <u>fundamental quantities.</u> Two examples of derived quantities are speed and force. Speed is equal to distance over time and force is equal to mass times distance per time per time.

(b) Figure 2 shows a graduated cylinder containing water before and after a stone is immersed.

If the mass of the stone is 50 g, calculate the

(i) Volume of the stone.

 $Volume = 300 \text{ cm}^3 - 100 \text{ cm}^3$ $Volume = 200 \text{ cm}^3$

(ii) Density of the stone. Density = Mass / Volume Density = 50 g / 200 cm³ Density = 0.25 g/cm³

- 5. (a) (i) List two characteristics of images formed by plane mirrors. Virtual
 - Laterally Inverted
 - (ii) Give a reason why the sky appears blue during a clear sunny day?
 <u>The sky appears blue because blue light has shorter wavelengths than other colours</u> and as a result it is scattered by molecules in the air.
 - (b) Draw the diagram of each of the following:
 - (i) Parallel rays of light.

(ii) Divergent rays of light.

Page 6 of 13 Find this and other free resources at http://maktaba.tetea.org

(iii) Convergent rays of light.

- 6. (a) Define the following terms as used in Physics and give their SI units:
 - (i) Work is the product of force and the distance moved in t he direction of the force. The SI unit of force is the newton (N).
 - (ii) Energy is the ability to do work. The SI unit of energy is the joule (J).
 - (b) A man lifts a load of 20 kg through a height of 4 m in 10 seconds. Calculate the:
 - (i) Work done.

$$Work = Force \times Distance$$

$$Work = Mass \times g \times Distance$$

$$Work = 20 kg \times 10 \frac{m}{s^2} \times 4 m$$

$$Work = 800 \frac{kg m^2}{s^2}$$

$$Work = 800 J$$

(ii) Power developed by the man

$$Power = \frac{Work}{Time}$$

$$Power = \frac{800 J}{10 s}$$

$$Power = \frac{800 J}{10 s}$$

$$Power = 80 \frac{J}{s}$$

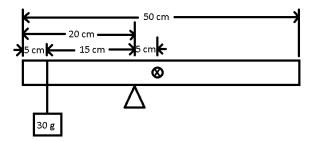

$$Power = 80 W$$

Page 7 of 13 Find this and other free resources at http://maktaba.tetea.org

SECTION C (40 Marks)

- 7. (a) (i) State the principle of moments <u>The principle of moments states that the moment of</u> <u>force about a point is equal to the product of the force and the perpendicular distance</u> <u>between the line of action of the force and the point.</u>
 - (ii) A uniform half metre rule is freely pivoted at the 20 cm mark and it balances horizontally when a body of mass 30 g is hung at 5 cm mark from one end. Calculate the mass of the rule.

It is a half metre rule, so the length is 0.5 m or 50 cm.The problem states that the rule is uniform, so the centre of mass will be at $\frac{1}{2}$ of the length. Therefore the centre of mass is at 25 cm.

- Sum of anticlockwise moments = Sum of clockwise moments
 - Force left × distance left = Force right × distance right
- $mass \ left \times g \times distance \ left = mass \ right \times g \times distance \ right$

mass left × distance left = mass right × distance right

 $30 g \times 15 cm = mass_{ruler} \times 5 cm$

 $\frac{30 \ g \times 15 \ cm}{5 \ cm} = mass_{ruler}$

 $90 g = mass_{ruler}$

- (b) (i) What is meant by equilibrium? <u>Equilibrium occurs when the sum of the forces and the</u> sum of the moments acting on an object are equal to zero.
 - (ii) List three applications of equilibrium in daily life. Heavy items are packed at the bottom of a bus to improve stability. Racing cars are built low to the ground with their wheels far apart to improve stability. Bunsen burners have very heavy bases to improve stability.

Page 8 of 13 Find this and other free resources at http://maktaba.tetea.org

- 8. (a) Define the following terms:
 - (i) Inertia <u>Inertia is the tendency for a body to not change its motion unless it is acted</u> upon by a force.
 - (ii) Impulse <u>An impulse is the change in momentum of a body when a force has been</u> applied to it. The SI unit of impulse is the Newton second (Ns).
 - (b) (i) Give two practical examples where impulse and momentum play an important role. <u>A practical application of impulse is the use of airbags in new cars. Airbags distribute</u> <u>the impulse a person experiences during an accident over a longer time, which means</u> <u>that the force on the person is smaller.</u> <u>An example of momentum is the game of pool, where the momentum of the cue ball is</u> <u>used to impart momentum to other balls.</u>
 - (ii) A tennis ball of mass 120 g moving at a speed of 10 m/s was brought to rest by one player in 0.02 seconds. Calculate the average force applied by the player.

$$Impulse = change in momentum$$

$$F \times t = m_f \times v_f - m_i \times v_i$$

$$F = \frac{m_f \times v_f - m_i \times v_i}{t}$$

$$F = \frac{120 g \times 0 \frac{m}{s} - 120 g \times 10 \frac{m}{s}}{0.02 s}$$

$$F = \frac{120 g \times 0 \frac{m}{s} - 120 g \times 10 \frac{m}{s}}{0.02 s}$$

$$F = \frac{-120 g \times 10 \frac{m}{s}}{0.02 s}$$

$$F = -60000 \frac{g m}{s^2} \times \frac{1 kg}{1000 g}$$

$$F = -60000 \frac{g m}{s^2} \times \frac{1 kg}{1000 g}$$

(In the step above we are converting from grams to kilograms so that our answer can be in SI units.)

Page 9 of 13 Find this and other free resources at http://maktaba.tetea.org

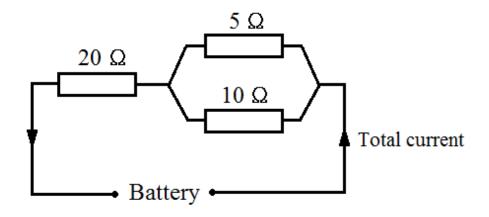

Candidate's Examination Number

$$F = -60 \frac{kg m}{s^2}$$
$$F = -60 N$$

- 9. (a) (i) What is the function of a rheostat in an electric circuit? <u>A rheostat is used in electric circuits to provide variable resistance.</u>
 - (ii) List four factors that affect the resistance of a conductor.

 (i) conductivity of the material
 (ii) length
 (iii) thickness
 (iv) temperature

(b) Study the circuit diagram in Figure 3, then answer the questions that follow:

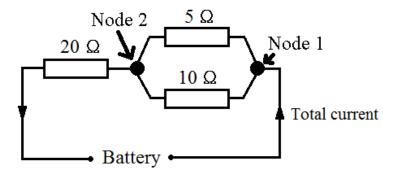

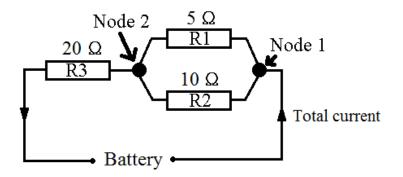

If the current flowing in 5 Ω resistor is 2 A, calculate the

(i) Current flowing in the 10 Ω resistor.

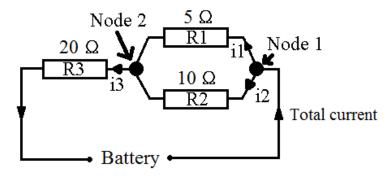

When solving circuit problems it is helpful to add labels. First we will label several nodes. Nodes are parts of a circuit in between components. In the figure below we label two nodes where the circuit branches and then comes back together.

We will also label the resistors R1 (the 5 ohm resistor), R2 (the 10 ohm resistor) and R3 (the 20 ohm resistor).

The current going through resistors R1, R2, and R3 will be i1, i2, and i3, respectively.

<u>R1 (the 10 ohm resistor) is in parallel with R2 (the 5 ohm resistor).</u> Therefore the potential difference across both resistors must be the same.

$$p.d.(10 \Omega resistor) = p.d.(5 \Omega resistor)$$

Page 11 of 13 Find this and other free resources at http://maktaba.tetea.org

```
i2 \times r2 = i1 \times r1
i2 \times 10 \Omega = 2A \times 5\Omega
i2 = \frac{2A \times 5\Omega}{10\Omega}
i2 = \frac{2A \times 5\Omega}{10\Omega}
i2 = 1A
```

(ii) Potential difference (p.d.) across the 20 Ω resistor.

<u>The sum of the current flowing into a node is the same as the sum of the current flowing</u> out of the node. Using this equation on Node 2 lets us solve for i3, the current flowing through the 20 ohm resistor.

Current out of Node 2	=	Current into Node 2
i3	=	<i>i</i> 1 + <i>i</i> 2
i3	=	2A + 1A
i3	=	3 <i>A</i>

The potential difference across a resistor is equal to the product of the current and resistance.

```
p.d. = i3 \times r3
p.d. = 3A \times 20 \Omega
p.d. = 60V
```

- 10. (a)(i)
 Define the term pressure and give its SI unit.

 Pressure is the force acting normally on a surface per unit area.

 The SI unit of pressure is the pascal (Pa).
 - (ii) Why are dams constructed thicker at the bottom than at the top? <u>Dams are constructed thicker at the bottom than at the top because pressure due to the</u> <u>water increases as depth increases.</u>

Page 12 of 13 Find this and other free resources at http://maktaba.tetea.org

(b) (i)	List three applications of hydraulic presses.		
	(i) hydraulic brakes		
	(ii) forging and punching metals		
	(iii) lifting heavy objects like cars		

(ii) A hydraulic brake has a force of 1000 N applied to a piston whose area is 50 cm². Calculate the pressure transmitted throughout the liquid.

Pressure	=	Force
		Area
Pressure	=	1,000 N
1,000010		$50 \ cm^2$

Now we will convert the squared centimetres to squared metres so we are working with SI units.

Pressure	=	$\frac{1,000 N}{100 cm} \times \frac{100 cm}{100 cm} \times \frac{100 cm}{100 cm}$
Pressure	_	$\frac{\overline{50 \ cm^2}}{1,000 \ N} \times \frac{1 \ m}{100 \ cm} \times \frac{1 \ m}{100 \ cm}$
Fressure	_	$5\theta \ cm^2 \times \frac{1}{N} m \times \frac{1}{N} m$
Pressure	=	200,000 $\frac{N}{m^2}$
Pressure	=	200,000 Pa
